

Report ID:	RPT-9B75B4EF	Generated:	2026-04-20 15:47:58 IST
Patient:	Anonymous	Study Date:	April 20, 2026
Patient ID:	N/A	Modality:	MRI Brain (AI Inferred)
Model:	BrainTumorAI v2.0 Ensemble	Model AUC:	0.9996 Acc 98.78%

PRIMARY FINDING

MENINGIOMA

Diagnosis: MENINGIOMA
Confidence: 50.2%
Risk Level: HIGH
Processing: 7.58s (TTA 6-view ensemble)
Method: EfficientNet-B3 + ResNet50+CBAM + DenseNet121

DIFFERENTIAL DIAGNOSIS

Class	Probability	Bar Chart	Notes
Glioma	8.7%		
Meningioma	50.2%		← Primary
No Tumor	27.0%		
Pituitary	14.1%		

ENSEMBLE AGREEMENT

Model	Confidence	Bar
EfficientNet-B3	75.0%	
ResNet50+CBAM	51.3%	
DenseNet121	16.1%	
Ensemble (TTA)	50.2%	← FINAL

CLINICAL INTERPRETATION

Imaging pattern is consistent with a meningeal-based lesion, potentially a meningioma. These are typically benign (WHO Grade I) but may cause symptoms due to mass effect. Contrast-enhanced MRI is advised to characterise the lesion. Neurosurgical consultation and close radiological follow-up are recommended. Grading requires histopathological confirmation.

RECOMMENDATIONS

- Contrast-enhanced MRI for lesion characterisation
- Neurosurgical consultation and watchful waiting assessment
- Annual imaging follow-up if conservative management chosen
- Visual field testing if lesion is near optic structures

■ **DISCLAIMER:** This report is generated by NeuroScan AI, an AI-assisted screening tool. It is intended for informational and research purposes only and does **NOT** constitute a medical diagnosis. All findings must be reviewed and confirmed by a qualified radiologist or neurologist before any clinical decision is made. Individual model performance may vary across patient populations and imaging protocols. Reported metrics: AUC 0.9996, Accuracy 98.78%, Sensitivity 98.68%, Specificity 99.59% (test set n=1,311 images). Report generated: 2026-04-20 15:47:58 IST | Report ID: RPT-9B75B4EF
