

PRIMARY FINDING

Diagnosis: PITUITARY
Confidence:  72.0%
Risk Level:  MODERATE
Processing: 7.78s (TTA 6-view ensemble)
Method: EfficientNet-B3 + ResNet50+CBAM + DenseNet121

[illegible]

Model	Confidence	Bar
EfficientNet-B3	93.4%	
ResNet50+CBAM	36.8%	
DenseNet121	78.5%	
Ensemble (TTA)	72.0%	← FINAL

CLINICAL INTERPRETATION

Findings raise the possibility of a pituitary region lesion, potentially a pituitary adenoma or sellar tumour. Dedicated pituitary protocol MRI, visual field assessment, and endocrinology referral are recommended. Hormonal panel (prolactin, GH, ACTH, TSH, FSH/LH) should be evaluated. Correlation with clinical symptoms (headache, visual changes, endocrine dysfunction) is essential.

RECOMMENDATIONS

1. Dedicated pituitary protocol MRI (thin coronal slices)
2. Endocrinology referral for hormonal evaluation
3. Visual field examination (Goldman / Humphrey perimetry)
4. Ophthalmology review if bitemporal hemianopia suspected

■ **DISCLAIMER:** This report is generated by NeuroScan AI, an AI-assisted screening tool. It is intended for informational and research purposes only and does **NOT** constitute a medical diagnosis. All findings must be reviewed and confirmed by a qualified radiologist or neurologist before any clinical decision is made. Individual model performance may vary across patient populations and imaging protocols. Reported metrics: AUC 0.9996, Accuracy 98.78%, Sensitivity 98.68%, Specificity 99.59% (test set n=1,311 images). Report generated: 2026-04-20 15:50:00 IST | Report ID: RPT-D0A441BF
